Wiltshire and Community Area Population Estimates and Projections 2001 to 2026: Trend based

July 2011

Maggie Rae, Director of Public Health and Protection Services

Wiltshire Council
Where everybody matters

Wiltshire and Community Area Population Estimates and Projections 2001 to 2026: Trend-based

This document provides estimates of population in Wiltshire Unitary Authority and community areas of Wiltshire for 2001 and 2009. It also provides projections of these same elements for individual years from 2010 to 2016, 2021 and 2026. Figures are given for both key variables including age structures as well as components of change. The projections presented in this document are "trend-based".

Wiltshire Council intends to supplement these projections with two further sets. Firstly, a "policy-based" set which will be consistent with the housing policies for each community area in Wiltshire as set out in the Wiltshire Core Strategy; and, secondly, a set of "experimental" projections which will seek to provide robust age-sex structures of Wiltshire's armed forces household population. In the case of the last two sets, projections will also be provided for 2010-2016, 2021 and 2026.

Wiltshire Population 2011

1   Introduction

1.1   The purpose of this publication is to present the results of Wiltshire Council's latest population projections. All data presented in this document have regard to the most recent national estimates of those elements which have a bearing on population change, such as births, deaths, and migrations.

1.2   The projections presented in this document are trend-based projections that are not constrained by local housing policy.

1.3   Wiltshire Council uses Popgroup to generate population projections. Popgroup was established by Bradford City Council and Andelin Associates with the support of its user group and was further developed by the Cathie Marsh Centre for Census and Survey Research (CCSR) at the University of Manchester. It is now owned by the Local Government Association and supported by Edge Analytics Ltd. Popgroup allows users to input a wide range of base data and constraints and uses standard demographic methods to produce the desired forecasts.

1.4   The whole projection methodology has been amended. This means figures enclosed in this report are not wholly consistent with those in previous population reports produced by Wiltshire County Council prior to 1st April 2009.

1.5   The tables in this report show the output of the population model employed by Wiltshire Council for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the period to 2026. Comparative Office for National Statistics (ONS) mid-year estimates are available for 2001 to 2009. ONS sub-national population projections are available for 2010 to 2026.

1.6   Careful consideration is advised before any projection data are used. This is especially applicable to community areas which have a large military presence, most notably Amesbury and Tidworth community areas. The trend-based projections presented provide an assessment of future population levels if recent trends are to continue.

Wiltshire Population 2011

1.7   All figures are presented rounded to the nearest ten.

2   Summary of projections

2.1   Trend-based projections

2.1.1   These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations. This is not to say they are unconstrained, as inputs for births, deaths, and migration have been constrained to corresponding projected input variables for Wiltshire in the Office for National Statistics sub-national population projections. In these projections migration is directly entered from national sources. This means that these projections are reliant on these migration estimates being fulfilled, which is very unpredictable, especially given changes to the European Union, with the addition of the accession countries.

2.1.2   Wiltshire Population 2011 estimates and projections for Wiltshire 2001 to 2026 closely follow ONS comparative mid-year estimates 2001 to 2009 and sub-national population projections 2010 to 2026. Wiltshire Population 2011 projected total population for Wiltshire is consistently around 600 to 1,200 persons less than those projected in ONS figures. This constitutes less that 0.4% variance. See Figure 2.1 below.

Figure 2.1 ONS and Wiltshire Population 2011 total population estimates mid-year 2001 to mid-year 2009, and projections mid-year 2010 to mid-year 2026.

2.1.3 In these trend-based projections, the difference in total population between various community areas in Wiltshire is significant. See Figure 2.2. Chippenham is Wiltshire's most populous community area with a projected mid-year 2011 total population of 44,530. Trowbridge and Salisbury community areas, containing Wiltshire's two other principal settlements (as identified in the Wiltshire Core Strategy consultation document , June 2011) are within Wiltshire's second and third most populous community areas with 41,700 and 41,370 persons respectively. Mere is projected to be Wiltshire's least populous community area with only 5,390 persons at mid-year 2011. At 159 square kilometres Chippenham community area is 56 percent larger than Mere community area, and yet Chippenham has a projected mid-year total population more than eight times larger than the projected total population of Mere for the same year.
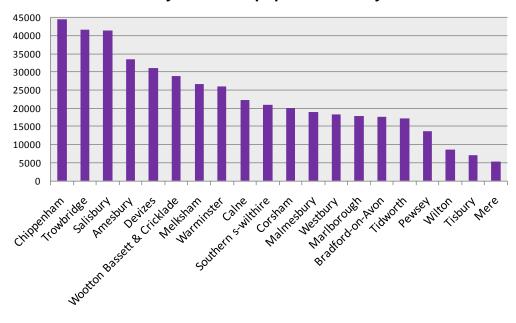

Figure 2.2 Ranked community area total population mid-year 2011

2.1.4 Wiltshire's total population is anticipated to see a rise of 18.2 percent over the whole period of these trend-base projections, mid-year 2001 to mid-year 2026. Six of Wiltshire's community areas are projected to experience percentage increases of their total populations greater than Wiltshire's 18.2 percent increase. These community areas are; Calne 45.9%, Westbury 35.7%, Trowbridge 32.2%, Devizes 31.9%, Corsham 27.7% and Melksham 23.7%. Seven community areas, of which Salisbury is one, are anticipated to change by less than 10 percent between mid-year 2001 and mid-year 2026. Only one community area in Wiltshire is anticipated to experience negative

growth. Tisbury's total population is projected to decrease by 4.4% during the projection period. See Table 2.1.

2.1.5 Note that projected percentage change mid-year 2001 to mid-year 2026 shown in Table 2.1 and described in 2.1.4 are trend-based projected percentage changes. See 1.6.

Table 2.1 Ranked Wiltshire and community area projected total population percentage change mid-year 2001 to mid-year 2026.

	% Change 2001 to 2026
Calne	45.9
Westbury	35.7
Trowbridge	32.2
Devizes	31.9
Corsham	27.7
Melksham	23.7
Wiltshire	18.2
Chippenham	17.1
Bradford-on-Avon	16.9
Warminster	16.3
Malmesbury	14.0
Marlborough	13.7
Pewsey	13.2
Amesbury	10.6
Salisbury	9.1
Tidworth	8.9
Mere	8.5
Southern Wilthire	7.3
Wootton Bassett & Cricklade	7.1
Wilton	0.6
Tisbury	-4.4

3   Projecting the population

3.1   The Popgroup projection model

3.1.1   The Popgroup model follows the well established single region cohort survival methodology. In its simplest form, this assumes that a group of people living in an area at any one time will be a year older one year later. A small proportion, mostly in older age groups, will have died; a proportion of women will have had children. However, allowing only for births and deaths results in a projection due to natural change only, which is unrealistic. Thus allowances are usually made for a proportion of the local population to move out of an area, and for other people to move in to the area.

Wiltshire Population 2011

Additionally to this, some set populations can be defined to maintain a set age structure and population total. This is particularly useful for transient populations such as the armed forces.

3.1.2   The new population projection methodology employed by Wiltshire Council has been used to project the population and age structure according to recent trends. The base for all these projections is mid-year 2001. The projection's final year is 2026 which matches the Wiltshire Core Strategy.

3.1.3   The model has been configured to operate in a limited multi-regional manner to enable projections to be undertaken for ex-districts as well as community areas. The component areas are constrained to totals and structures calculated at ex-district level. Ex-district areas do not exactly align with the current community area boundaries created on 1st April 2009. For this reason separate estimation has been applied to create pseudo-district geographies which are the exact sum of its community area geographies. Input data has been apportioned using this separate estimation. This process is referred to in this document as 'separate estimation 3.1.3'.

3.1.4   The starting point for any projection is the population base. This has been taken from the Census which is representative of April 2001. However, to achieve a mid-year estimate by single year of age, the Census data has been simply controlled forward to the ONS mid-year estimates.

3.1.5   The more detailed the information from the Census; the more the data is subject to disclosure control by way of random adjustment. Therefore, it is possible that some of the smaller groups may be unrepresentative. However, the impact of these minor changes will make little difference to the overall projection and should be minimised by controlling to the mid-year estimates. These mid-year estimates, 2001 (population base 3.1.4) and 2002-2009, have been subject to a military adjustment which incorporates data from Wiltshire Council's annual Armed Forces Returns Survey.

3.1.6   The 2001 Census enumerated students at their term-time address, and this practice has been adopted for these estimates and projections. For Wiltshire, however,

this has significant ramifications as the county does not contain a university, and so the students from Wiltshire will be counted at their place of study outside of the county.

3.2   Special populations

3.2.1   The Popgroup model allows the user to define special populations. These groups can be independently controlled to pre-defined age structures and population totals. In the case of Wiltshire, this is especially useful in accounting for the prison population, the armed forces in barracks and the school boarders. All of these groups have their own specific age structures and locally sourced information regarding the number in these groups is available. By classing these groups as special populations it means that they are distinct from the general population, and so can maintain the appropriate population structure.

3.2.2   Armed forces in barracks are taken from the Armed Forces Returns Survey carried out by Wiltshire Council for 2001 through to 2010. Age structures for armed forces are taken from the Armed Forces Profiles model created by Wiltshire Council. This model incorporates MOD Defence Analytical Services Agency (DASA) data, specifically TSP 8: Age Distribution of UK Regular Forces. Projected armed forces personnel numbers to 2016, an output from Wiltshire Council's 'Envisioning the Future' report 2009, have been applied to the Armed Forces Profiles model and incorporated within these projections. For years 2017 through 2026 numbers of projected armed forces in barracks for 2016 by age and sex have been assumed.

3.2.3   The total prison population is taken from monthly data provided on the Ministry of Justice website. Wiltshire has just one prison; Erlestoke Prison in Devizes community area. Yearly totals are the average monthly total from year beginning 1st July to year ending 30th June the following year. The age structure is taken from the 2001 Census. Erlestoke prison total population is projected by the Ministry of Justice to remain at 2009 levels until 2016. In these projections the total population and age structure for 2009 have been held constant for 2010 to 2026.

3.2.4   The number of school boarders is calculated from data supplied by the Department for Education and Skills (DfES) (think this is now just called the Department

for Education) to 2009. The age and sex of boarders at a given school was controlled to the age and sex distribution of full time students at that school in that particular year. In these projections the total population and age structure of school boarders for 2009 have been held constant for 2010 to 2026.

3.2.6   The popgroup model subtracts these groups classified as special populations from the total population, thereby leaving the non-special population. At the final stage these will be added back in according to the manual estimation and projection of these groups.

3.3   Non-special population

3.3.1   The non-special population should also be subdivided into civilian and armed forces households; however this second group are very hard to count. One potential source for recording the number and movements of the armed forces is data taken from NHS registrations. However, some armed forces establishments provide separate health care and so by no means all of the armed forces register with the NHS.

3.3.2   Historically, the armed forces household population has not aged in the same way as the civilian population, but has changed by relatively frequent replacement, thereby maintaining a broadly static age structure. However, with proposed changes by the MOD that means that members of the military will be stationed at one military site for longer periods, the ageing of this group will more closely reflect that of the broader population. For these projections no special treatment is afforded to the armed forces household population, but this remains a somewhat arbitrary approach, pending the development of a more appropriate methodology. Wiltshire Council's planned "experimental" projections will attempt to take better account of armed forces household populations.

3.4   Natural change

3.4.1   The number of births and deaths has been taken from the ONS Vital Statistics at district level. This data has been apportioned to community areas outside of the model, and then inserted into the model. For the projection period, data has been taken from

the ONS sub-national population projections, which include long-term assumptions on fertility and mortality change, and apportioned by the same method adopted for vital statistics.

3.5   Migration

3.5.1   The other component of change for the population is migration. This can be sub-divided into migration flows within the UK and those to or from overseas. These have been separately calculated and input.

3.5.2   Ex-district internal migration flows have been taken from counts of patient-based migrants from 2001/2 each year to 2008/2009, for each ex-district. Ex-district schedules are the weighted average of patient-based migrant counts 2003/4 to 2007/8 divided by the weighted average of the population at the beginning of these annual periods. For ex-districts total internal migration estimates and total internal migration projections, based on ONS sub-national population projections flows, and subject to separate estimation 3.1.3, have been inserted in to the model.

3.5.3   For community areas the standard rate takes the shape of national migration rates, scaled to the 'small area' 2001 experience within each age group 0-17, 18-29, 30-44, 45+. The forecast uses the schedule of group rates which are further scaled to the migration for the 2001 census wards most closely associated with the small area. For community areas total internal migration estimates and total internal migration projections, based on ONS sub-national population projection flows, both constrained to corresponding ex-district totals and subject to separate estimation 3.1.3, have been inserted in to the model.

3.5.4   Ex-district counts of international migrants for 2002/03 to 2008/2009 are taken from ONS estimates. Ex-district migrant counts from 2009/2010 onwards are the weighted average of mid-2000 to mid-2009 held constant. These are the residual migration after deducting counts of births, deaths, and UK migrants from population change for years in which they are all recorded, again subject to separate estimation 3.1.3.

3.5.5   For community areas the standard rate takes the shape of international migration rates, scaled to the 'small area' 2001 experience within each age group 0-17, 18-29, 30-44, 45+. The forecast uses the schedule of group rates which are further scaled to the migration for the 2001 census wards most closely associated with the small area. For community areas total international migration estimates and total international migration projections, both constrained to corresponding ex-district totals and subject to separate estimation 3.1.3, have been inserted in to the model.

3.5.6   These migration flows are applied to the general population to produce a projection of this population. Then the special populations are added to provide a total population for the year following the base. This process is repeated until the end of the projection period, and provides an ONS sub-national population projection constrained trend-based projection.

3.5.7   These components of change are applied to the general population to provide a population that is one year older, but has undergone births and deaths. This results in a natural change projection without the inclusion of migration flows, which are increasingly a large component of change.

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates

Notes

The table above shows the Popgroup estimates output for 2001 and 2009, the latter year forming the starting point for the annual projections shown for the remainder of the projected period.

These estimates and projections are calculated using a 2001 Census base for each Community Area (using 01/04/2009 Community Area boundaries).

They incorporate ONS mid-year estimates 2001-2009, Vital Statistics of births and deaths 2001-2009, Patient Registration Statistics and ONS 2008 based Sub-National Population Projections.

These trend-based projections do not incorporate any housing policy figures and instead use recent trends to anticipate future populations.

This means assumptions for future levels of births, deaths and migration are based on observed levels mainly over the previous five years. They show what the population will be if recent trends continue.

Special populations shown above are independently controlled to pre-defined age structures and population totals.

All population figures have been rounded independently to the nearest 10. 0 signifies less than 5. Figures may not sum due to rounding.

This report was compiled from a forecast produced on 27/10/2010 using POPGROUP software Developed by Bradford Council, the University of Manchester and Andelin Associates
